

BUSINESS CONTINUITY GATEWAY

An email security solution that defends your network perimeter from email threats, spam and viruses and provides a cost-effective layer of redundancy. Your business runs on email. What happens when your email stops running? Email downtime, whether scheduled, accidental or malicious can cause messages to be bounced back to your clients and vendors, souring your company's image. The cost to you is not easy to quantify. Protect your reputation and security with our Business Continuity Gateway solution. GMSI's gateway lets you rest assured.

Anti-Virus, Anti-Spam Gateway

GMSI's Business Continuity Gateway speeds each message through an advanced filtering process that has been proven to virtually eliminate spam and virus-infected email. Legitimate messages race through the filter and are delivered within seconds to your network.

Eliminate Lost and Bounced Email Messages

The gateway provides a cost-effective layer of redundancy. If your network fails, we queue the messages that cannot be delivered, retaining them until function is restored. We then use a sophisticated mathematical algorithm to throttle messages back to your users without bombarding your server. We never delete your messages from our servers until successful delivery to your network is confirmed.

Eradicate Email Susceptibility

Constantly the target of costly dictionary and directory harvest attacks, mail bombs and denial of service threats, your email server needs all the protection it can get. Our gateway functions as a firewall in front of your mail server. Simply enabling port 25 on your server and firewall to accept only SMTP traffic from GMSI's gateway servers makes vulnerability a thing of the past.

Save in Bandwidth, Storage and Administrative Costs

Today's innumerable email security threats promise to rob you of productivity and repute. Email has become a race of catastrophe prevention, and GMSI is sprinting ahead. GMSI's gateway service features first-class reliability and security features. The service is built on an advanced network of redundant, geographically-diverse datacenters and Tier-1 network connectivity. While many of our competitors rely on only one or two networks, GMSI maintains redundant connectivity on 15 Tier-1 networks. This means that while a network failure would bring down the service of many of our competitors, GMSI's multiple connectivity strategy and inherent redundancy features ensure that GMSI's service will always be there when you need it.
